

## Grommet punch – Spear & Jackson Hardware

### Description

THIS PRODUCT: Hammer Required for Use.

IN GENERAL: A grommet punch is a hand tool designed specifically for installing grommets, also known as eyelets, into various materials, including fabric, leather, canvas, plastic, and more. Grommets are typically used to reinforce holes and provide a secure, finished look. The grommet punch allows for precise and efficient grommet installation.

- **Structure:** A grommet punch typically consists of a pair of handles, similar to pliers, with a built-in grommet setting mechanism. One handle houses a hole-punching component, and the other handle has a receptacle for the grommet and a setting tool.
- **Punching and Setting:** A hammer is usually required for this tool. The tool is used by first positioning the hole-punching component over the material where the grommet is to be installed. Squeezing the handles together punches a clean hole in the material. Then, the grommet is placed through the hole, with the flanged or flat side on one side of the material and the tubular shaft protruding from the other. Finally, squeezing the handles again sets the grommet in place, securing it firmly.
